REGION II
HABITAT AND RESTORATION DIVISION

IMPORTANT: Provide all supporting documentation that this water body is important for the spawning, rearing or migration of anadromous fish, including: number of fish and life stages observed; sampling methods, sampling duration and area sampled; copies of field notes; etc. Attach a copy of a map showing location of mouth and observed upper extent of each species, as well as other information such as: specific stream reaches observed as spawning or rearing habitat; locations, types, and heights of any barriers; etc.

Comments:

Pt. Thomson area stream surveys were initiated in August 2002. One juvenile Dolly Varden was captured in a single 48-hour fyke net sampling event.
All Dolly Varden captured were between 115mm and 220mm fork length.
Number of fish listed is a sum of Dolly Varden char captured in all nets fished within a system, usually 2 nets.

Attached map shows furthest upstream net in system that captured Dolly Varden char.

GPS location of net site is provided on attached map, GPS locations are presented in NAD27, in decimal degrees.
Trip Report "ADF&G Point Thomson Area Stream Fish Sampling, August 1-8, 2002, Trip Report" by Jack Winters and William Morris is also attached.

ADF&G Point Thomson Area Stream Fish Sampling
August 1-8, 2002
Trip Report

Jack F. Winters
William A. Morris

From August 1 through 8, 2002, the Alaska Department of Fish and Game (ADF&G) conducted fish surveys in streams crossed by the proposed Point Thomson Gas Cycling Project. The stream surveys were designed to provide preconstruction fish and water quality data for selected streams in the Point Thomson proposed development area, to provide data to support permit applications, and to make and support permit decisions.

Fish were captured with fyke nets set within the streams or in lakes attached to the streams. The wings and leads of the nets were set to capture fish moving upstream and downstream. Nets were fished from 2 to 3 days at each net site. One net was set in the Alaska State #1 flooded material site. Net sites were selected to coincide with or just upstream of the proposed pipeline, road, and material site locations. Generally, two nets were set in streams crossed by the proposed facility roads and infield pipeline. One net was set in streams crossed by the proposed sales pipeline. Dolly Varden and fourhorn sculpin were measured and released. Ninespine stickleback were counted and released, but not measured.

Water quality parameters (temperature, specific conductance, pH, dissolved oxygen concentration, and dissolved oxygen percent saturation) were measured at each net site with a Hydrolab® Minisonde® water quality microprobe connected to a Surveyor® 4 water quality display unit.

Fifteen streams and one flooded mine site were sampled for fish. All fifteen streams contained ninespine stickleback as did the flooded Alaska State #1 mine site. Seven of the fifteen streams contained anadromous juvenile Dolly Varden, which ranged in length from 115 to 220 mm. One sample site also contained 12 fourhorn sculpin.

Catches of Dolly Varden were low, ranging from 0 to 6 per day per net. The total catch of Dolly Varden was 42 fish. Catches of ninespine stickleback ranged from 0 to 398 fish per day per net. The total catch of ninespine stickleback was 3078 fish.

Subject: RE: Arctic nominations

These are anadromous because these streams have zero overwintering habitat. They are too shallow and no springs exist at any of them. The systems are used during summer for rearing. Only a handful of systems up on the coastal plain have water during winter, these do not, the nearest systems that winter fish in the area are the Canning to the east and the Shaviovik to the west.

Bill

Bill
Do you consider these DV anadromous solely because of their presence in the streams?
I was wondering if you have any additional info to support the inclusion of Dolly Varden as anadromous species in Pt. Thomson area streams.
Has there been any tagging or tracking studies that indicate DV are not over wintering in the nominated streams.
If so, I'd like to see copies of any pertinent reports.
